Lab 06: Revision, voiceover and rough-cut plan

Course: Generative AI for Script Development and Storytelling · TGS-2025056983 · v2.0

Outcome: LO3: Utilise generative AI tools to refine video scripts for clarity, tone, and narrative consistency.

Build: revision diff, audio script, production manifest and rough-cut checklist.

Preparation

1. Open story-assets/story-brief.md. Record the intended audience effect, central conflict and duration constraint.

2. Open story-assets/character-cards.md and scene-slate.md. Fill only facts that are supported by your creative decisions; label unresolved items TBD.

3. Open both CSV ledgers. Confirm all names and events are fictional classroom material and do not substitute personal data or unlicensed media.

Detailed workflow

4. Start a new workspace or chat in a generative AI tool available to you. Paste the relevant role prompt from prompts.pdf and attach only this lab's files.

5. Ask the story architect for two controlled variants. Compare them using audience fit, causality, originality, feasibility and ethical risk. Record why you selected one.

6. Create a revision table with scene ID, failed criterion, evidence, edit and intended audience effect.

7. Separate visible information from voiceover; delete narration that merely describes the image.

8. Map script, panel, voice, sound and caption asset IDs on a 90-second rough-cut timeline and run the acceptance checklist.

9. Run the editor prompt. Copy each defect into a revision table, revise only the failed criteria and preserve the earlier version for comparison.

10. Run the reviewer prompt. Resolve or assign every bias, fact, rights, privacy, disclosure and accessibility finding. Update rights-ledger.csv for every generated or imported asset.

11. Act as the human creative director. Approve, revise or block the artifact; record the decision, creative rationale, version and date. Do not publish during class.

Acceptance checks

- Deliverable exists: revision diff, audio script, production manifest and rough-cut checklist.

- Every scene has an ID and produces a measurable change in knowledge, value or emotion.

- Continuity states are complete or explicitly TBD; generated assets have rights/provenance entries.

- At least one revision shows a before/after difference tied to a named criterion.

- Reviewer records PASS, REVISE or BLOCK and human creative approval is distinct.

Evidence to submit

Save the brief, prompt/output transcript, artifact versions, continuity and rights ledgers, review result and human decision in an evidence/ folder named for this lab. Include one screenshot of the final approved state.
