Lab 08: Authenticity, privacy and disclosure gate

Course: Generative AI for Script Development and Storytelling · TGS-2025056983 · v2.0

Outcome: LO4: Analyse generative AI outputs for ethical issues, bias, and copyright risks, applying appropriate corrective actions.

Build: safe prompt pack, authenticity statement, disclosure decision and release record.

Preparation

1. Open story-assets/story-brief.md. Record the intended audience effect, central conflict and duration constraint.

2. Open story-assets/character-cards.md and scene-slate.md. Fill only facts that are supported by your creative decisions; label unresolved items TBD.

3. Open both CSV ledgers. Confirm all names and events are fictional classroom material and do not substitute personal data or unlicensed media.

Detailed workflow

4. Start a new workspace or chat in a generative AI tool available to you. Paste the relevant role prompt from prompts.pdf and attach only this lab's files.

5. Ask the story architect for two controlled variants. Compare them using audience fit, causality, originality, feasibility and ethical risk. Record why you selected one.

6. Remove names, contact details and unnecessary personal data from the prompt pack.

7. Write whose experience supports the story and obtain consent for any real contribution or voice.

8. Decide whether synthetic media disclosure is material, then record PASS, REVISE or BLOCK with human approval.

9. Run the editor prompt. Copy each defect into a revision table, revise only the failed criteria and preserve the earlier version for comparison.

10. Run the reviewer prompt. Resolve or assign every bias, fact, rights, privacy, disclosure and accessibility finding. Update rights-ledger.csv for every generated or imported asset.

11. Act as the human creative director. Approve, revise or block the artifact; record the decision, creative rationale, version and date. Do not publish during class.

Acceptance checks

- Deliverable exists: safe prompt pack, authenticity statement, disclosure decision and release record.

- Every scene has an ID and produces a measurable change in knowledge, value or emotion.

- Continuity states are complete or explicitly TBD; generated assets have rights/provenance entries.

- At least one revision shows a before/after difference tied to a named criterion.

- Reviewer records PASS, REVISE or BLOCK and human creative approval is distinct.

Evidence to submit

Save the brief, prompt/output transcript, artifact versions, continuity and rights ledgers, review result and human decision in an evidence/ folder named for this lab. Include one screenshot of the final approved state.
